## Big Time Review

1) Conversions
a) $55 \mathrm{~km}=? \mathrm{~m}$
c) $25 \mathrm{mg}=? \mathrm{~g}$
55000 m
0.025 g
b) $425 \mathrm{cL}=$ ? mL
d) $25,000 \mathrm{~J}=? \mathrm{~kJ}$
4250 mL
25kJ
2) How many Significant figures?
a) 10.1
b) 0.00556
3
3
c) 0.0001
d) $1.0 \times 10^{-3}$
2
3) Calculations with Significant Figures
a) $0.0026 \times 10 .=$
$2.6 \times 10^{-2}$
b) $236.1+0.00999=\_236.1$
c) $102.3 \div .0023=\left[4.4 \times 10^{-4}\right.$
d) $0.01256-1.096=\underline{1.083}$
4) Scientific Notation and Sig Figs
a) $0.02568=$ $\qquad$ b) $0.000589=\ldots 5.89 \times 10^{-4}$
c) $1.5 \times 10^{-3} \cdot 5.00 \times 10^{+5}={ }_{-} 7.2 \times 10^{2}$
d) $\frac{1.0 \times 10^{-14}}{1.56 \times 10^{-7}}={ }_{-} 6.4 \times 10^{-8}-$
5) In the lab you measure the room temperature to be $23.5^{\circ} \mathrm{C}$, but the more actual temperature was $23.2^{\circ} \mathrm{C}$. What was your percent error?

$$
\frac{23.5-23.2}{23.2} \times 100=1.29 \%
$$

6) Give several examples of physical properties.

Color, density, Boiling point
7) Give several examples of chemical properties.

Any chemical reaction
8) What is the difference between a compound and an element?

Compound is several elements bonded together
9) Explain how a cathode ray tube explained the existence of the electron. Who was credited with the discovery of the electron?

Thomson - bent a beam of electrons with a magnetic field - electrons came from the metal
10) Explain how the results of Rutherford's gold foil experiment explained the presence of a dense, positive nucleus.

1 in 6000 alpha particles was deflected - nucleus is small
Since they repelled, must be the same charge. Alpha particles are positive charge, so is the nucleus.
Since they were deflected, and alpha particles are massive (dense), so is the nucleus.
11) Describe the following:

Atomic number - \# protons
Mass Number - \#protons + neutrons

## Average Atomic Mass

Mass of a sample with mixed isotopes
12)

|  | Name | At \# | At Mass | p | n | e | charge |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ${ }^{37}{ }_{17} \mathrm{Cl}^{-1}$ | Chlorine -37 | 17 | 37 | 17 | 20 | 18 | -1 |
| ${ }^{81}{ }_{35} \mathrm{Br}^{\mathrm{o}}$ | Bromine-81 | 35 | 81 | 35 | 46 | 35 | 0 |
| ${ }^{146}{ }_{60} \mathrm{Nd}^{\mathrm{o}}$ | Neodynium-146 | 60 | 146 | 60 | 86 | 60 | 0 |
| ${ }_{8}^{19} \mathrm{O}^{-2}$ | Oxygen-19 | 8 | 19 | 8 | 11 | 10 | -2 |
| ${ }^{121}{ }_{51} \mathrm{Sb}^{+5}$ | Antimony-121 | 51 | 121 | 51 | 70 | 46 | +5 |

13) What were Dalton's laws and which ones were not entirely correct? Explain how they were incorrect.
14) Everything is made up of atoms (yes)
15) Atoms are indestructible (no, nuclear reactions)
16) Atoms of the same element are the same, different elements are different (no, isotopes and ions)
17) Atoms join in specific whole number ratios to make compounds (yes)
18) Why do colors appear when hydrogen gas is exposed to electric current? Use the Bohr model to explain. Electrons are excited to a higher energy level. When they drop back down to lower levels, they release energy of a specific wavelength (since the energy levels are quantized) Those wavelengths $=$ specific colors of light.
19) What are the major differences between the Quantum Mechanical model and the Bohr model of the atom?

Quantum - electrons are in clouds, orbitals where there is a probability of finding them.
Bohr - electrons orbit in rings which are their energy levels.
16) In quantum mechanics, what is the volume of space that the electron in probably in called?

Orbital

## Nuclear

17) Explain the differences between make-up and penetrating power for alpha particles, beta particles, and gamma rays.

Alpha - helium nucleus - low penetrating power
Beta - electron - high penetrating power
Gamma - energy (EM wave) - very high penetrating power
18) Explain the differences between fission and fusion regarding the fuels and the way reaction occurs.

Fission - large unstable nucleus is broken into 2 small nuclei (U-235)
Fusion - 2 small nuclei (H) combine to make one larger one
Change in mass $=$ energy $E=\mathrm{mc}^{2}$ for both
19) Balance the following nuclear equation:

$$
{ }^{14} \mathrm{~N}+{ }_{2}^{4} \mathrm{He} \rightarrow{ }^{0}{ }_{-1} \mathrm{e}+{ }^{18}{ }_{10} \mathrm{Ne}
$$

20) How much energy is in a beam of light with a wavelength of $6.32 \times 10^{-14} \mathrm{~m}$ ?

$$
\mathrm{c}=\lambda \mathrm{v} 3 \times 10^{8} \mathrm{~m} / \mathrm{s}=6.32 \times 10^{-14} \mathrm{~m}(\mathrm{v}) \quad v=4.75 \times 10^{21} \mathrm{~s}^{-1} \quad \mathrm{E}=\mathrm{h} v \quad \mathrm{E}=\left(6.626 \times 10^{-34} \mathrm{Js}\right)\left(4.75 \times 10^{21} \mathrm{~s}^{-1}\right)
$$

$$
\mathrm{E}=3.15 \times 10^{-12} \mathrm{~J}
$$

21) Tungsten has five common isotopes present in the following percentages: tungsten- 180 at $0.100 \%$, tungsten 182 at $26.3 \%$, tungsten 183 at $14.3 \%$, tungsten-184 at $30.7 \%$, and tungsten- 186 at $28.6 \%$. What is the average atomic mass of tungsten?
$180 \times 0.001=1.8 \times 10^{-1}$
$182 \times .263=47.866$
$183 \times 0.143=26.169$
$184 \times 0.307=56.488$
$186 \times 0.286=53.196 \quad$ add together $=183.90$

## Periodic Table

22) What is the periodic Law?

With increasing atomic number, the chemical properties of the elements repeat
23) On the periodic table, distinguish between:

Periods - rows
Groups - columns
Metals - left side of staircase (give up electrons)
Non-metals - right side of staircase (gain electrons)
Semi-Metals - one the staircase (both metal and nonmetal properties)
24) On the periodic table identify where to find the:
$\begin{aligned} & \text { S-block, D-block, P-Block and F-block s=group } 1+2, \\ & \text { Alkali Metals - Group 1 }\end{aligned}$
$\begin{aligned} & \mathrm{p}=\text { groups } 13-18 \mathrm{~d}=\text { groups } 3-12 \\ & \text { Alkali Earth Metals - group 2 } \\ & \text { Transition Metals - groups 3-12 }\end{aligned}$
Halogens - group 17
Noble Gases - group 18

## Periodic Trends

25) Describe the trends and give a reason for each:
a) Atomic radius
increases as you go down and increases as you go to the left

- Why does it get smaller across a period, larger down a family/group?

Across a period - more protons in same energy level = smaller atom electrons more attracted to the nucleus Down a column - more energy levels $=$ larger atom
b) Ionic Size
increases as you go down - more energy levels
decreases when more protons are pulling on the same number of electrons
-Why is an anion larger than a cation from the same period?
-anions gain electrons to fill their outer energy level, cations lose electrons to shed their outer level
c) Electronegativity

Increases as you go up and to the right - noble gases EN $=0$
Why is it related to the number of protons in the nucleus and number on energy shells?
More protons- smaller atom $=$ easier to attract electrons
More energy levels $=$ larger atom $=$ harder to attract electrons
Chemical Formulae and Bonding
26) What are the difference between a covalent and ionic bonds?

Covalent $=$ two elements with large electronegativities $=$ can't steal electrons $=$ share Ionic $=$ one element with a low electronegativity, one with high $=$ electrons are transferred
27) Explain how the octet rule can be used to predict the charge of elements in the $S$ and $P$ blocks. Why is this not true of the D block?

Atoms want to have their s and p sublevels filled which equals 8 electrons, they bond in order to accomplish this
d- block elements have other electrons that can get involved so they have other possibilities of being happy
28) What is a valence electron?

Electrons in the outermost energy level
29)

Names
$\mathrm{Mg}(\mathrm{OH})_{2}$
Magnesium hydroxide
$\mathrm{Na}_{3} \mathrm{~N}$
Sodium nitride
$\mathrm{PCl}_{3}$
Phosphorous trichloride
$\mathrm{H}_{2} \mathrm{SO}_{4}$
Sulfuric acid
$\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}$
Ammonium carbonate
$\mathrm{H}_{2} \mathrm{CO}_{3}$
Carbonic acid
$\mathrm{Be}\left(\mathrm{ClO}_{3}\right)_{2}$
Beryllium chlorate
$\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}$
Copper(II)nitrate

## Formulas

Iron (III) Oxide
$\mathrm{Fe}_{2} \mathrm{O}_{3}$
Potassium bromide
KBr
Uranium (II) nitrate
$\mathrm{U}\left(\mathrm{NO}_{3}\right)_{2}$
Arsenic pentaiodide
$\mathrm{AsI}_{5}$
Cesium chromate
$\mathrm{Cs}_{2} \mathrm{CrO}_{4}$
Strontium nitrite
$\mathrm{Sr}\left(\mathrm{NO}_{2}\right)_{2}$
Titanium (V) oxide
$\mathrm{Ti}_{2} \mathrm{O}_{5}$
Chromium (I) chromate
$\mathrm{Cr}_{2} \mathrm{CrO}_{4}$
Aluminum sulfate pentahydrate
$\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot{ }^{\cdot} 5 \mathrm{H}_{2} \mathrm{O}$
30) Draw the lewis dot structures for the following molecules and determine if they are polar
Methanol $\left(\mathrm{CH}_{3} \mathrm{OH}\right) \quad$ Nitrogen tribromide

Polar
Asymmetric

Polar
Asymmetric

Carbon dioxide
non polar symmetric asymmetric
$\mathrm{CH}_{4}$ nonpolar symmetric

## Chemical Reactions and Equations

31) Why must a chemical equation be balanced?

Law of conservation of matter
32) Balance the following chemical equations.

| $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}$ | $\rightarrow$ | $2 \mathrm{NH}_{3}+$ | $\mathrm{H}_{2} \mathrm{O}+$ | $\mathrm{CO}_{2}$ |
| :--- | :--- | :--- | :--- | :--- |
| $2 \mathrm{KClO}_{3}$ | $\rightarrow$ | $2 \mathrm{KCl}+$ | $3 \mathrm{O}_{2}$ |  |

33) Calcium phosphate and silicon dioxide are mixed to produce tetraphosphorus decaoxide and calcium silicate $\left(\mathrm{CaSiO}_{3}\right)$.
$2 \mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}+6 \mathrm{SiO}_{2} \rightarrow \mathrm{P}_{4} \mathrm{O}_{10}+6 \mathrm{CaSiO}_{3}$
34) Phosphorus pentachloride and water react to produce phosphoric and hydrochloric acids
$\mathrm{PCl}_{5}+4 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{PO}_{4}+5 \mathrm{HCl}$
35) Give an example of the following types of reactions:
a) Direct combination
$2 \mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}$
b) Single replacement
$\mathrm{Mg}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2}$
c) Double replacement
$\mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
d) Decomposition
$2 \mathrm{NaCl} \rightarrow \mathrm{Na}+\mathrm{Cl}_{2}$
e) Combustion
$\mathrm{CH}_{4}+2 \mathrm{O}_{2} \rightarrow \quad \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$
36) Write the balanced the equation and determine type of reaction:
a) Copper (III) chloride reacts with sulfur to produce a gas and a salt.
$2 \mathrm{CuCl}_{3}+3 \mathrm{~S} \rightarrow \mathrm{Cu}_{2} \mathrm{~S}_{3}+3 \mathrm{Cl}_{2}$ single replacement
b) Calcium carbonate is heated to produce an oxide and a gas.

Hint: the gas puts out fires.
$\mathrm{CaCO}_{3} \rightarrow \mathrm{CaO}+\mathrm{CO}_{2}$ decomposition
c) Magnesium hydroxide and phosphoric acid neutralize each other.
$3 \mathrm{Mg}(\mathrm{OH})_{2}+2 \mathrm{H}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{Mg}_{3}\left(\mathrm{PO}_{4}\right)_{2}+6 \mathrm{H}_{2} \mathrm{O}$ double replacement
d) Uranium metal reacts with concentrated sulfuric acid to produce a gas and a uranium (III) salt. $2 \mathrm{U}+3 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{U}_{2}\left(\mathrm{SO}_{4}\right)_{3}+3 \mathrm{H}_{2} \quad$ single replacement
e) Nickel (II) bromide and sodium phosphate yield
$3 \mathrm{NiBr}_{2}+2 \mathrm{Na}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{Ni}_{3}\left(\mathrm{PO}_{4}\right)_{2}+6 \mathrm{NaBr}$
37) What is the percent composition of calcium in calcium phosphate?
$\mathrm{Ca}_{3} \mathrm{PO}_{4} 3(40.08)+2(30.97)+8(16)=310.06$

$$
\frac{120.24}{310.06} \times 100=38.78 \% \mathrm{Ca}
$$

## Stoichiometry

38) In \#36a, how many liters of gas at STP would be produced from the reaction of 16.5 g of copper(III)chloride with excess sulfur?
$\frac{16.5 \mathrm{~g} \mathrm{CuCl}_{3}}{1} \times \frac{1 \mathrm{~mole} \mathrm{CuCl}_{3}}{169.9 \mathrm{~g} \mathrm{CuCl}_{3}} \times \frac{3 \mathrm{~mole} \mathrm{Cl}_{2}}{2 \text { mole CuCl}_{3}} \times \frac{22.4 \mathrm{~L} \mathrm{Cl}_{2}}{1 \mathrm{~mole} \mathrm{Cl}_{2}}=3.26 \mathrm{~L} \mathrm{Cl}_{2}$
39) In \#36a, how many formula units of the salt are created from a reaction with 5.38 g of sulfur reacting with excess copper(III)chloride?
$\frac{5.38 \mathrm{~g} \mathrm{~S}}{1} \times \frac{1 \mathrm{~mole} \mathrm{~S}}{32.06 \mathrm{~g} \mathrm{~S}} \times \frac{3 \operatorname{mole~Cu}_{2} \underline{\mathrm{~S}}_{3}}{3 \mathrm{~mole} \mathrm{~S}} \times \frac{6.02 \times 10^{23} \text { atoms } \mathrm{S}}{1 \mathrm{~mole} \mathrm{Cu}_{2} \mathrm{~S}_{3}}=3.37 \times 10^{22} \mathrm{FU} \mathrm{Cu}_{2} \mathrm{~S}_{3}$
40) In \#36a, how many atoms of sulfur were reacted with excess copper(III)chloride if 83.5 g of the gas was created?
$\frac{83.5 \mathrm{~g} \mathrm{Cl}_{2}}{1} \times \frac{1 \mathrm{~mole} \mathrm{Cl}_{2}}{70.9 \mathrm{~g} \mathrm{Cl}_{2}} \times \frac{3 \mathrm{~mole}^{3}}{3 \mathrm{~mole} \mathrm{Cl}_{2}} \times \frac{6.02 \times 10^{23} \text { atoms } \mathrm{S}}{1 \mathrm{~mole} \mathrm{~S}}=7.09 \times 10^{23}$ atoms S

## Energy

41) How much would the temperature of water change if 62.5 kJ of energy was added to a 3.00 kg sample? $\Delta \mathrm{H}=\mathrm{m} \mathrm{C} \Delta \mathrm{T}$

$$
62500 \mathrm{~J}=3000 \mathrm{~g}\left(4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}\right)(\Delta \mathrm{T}) \quad \Delta \mathrm{T}=4.98^{\circ} \mathrm{C}
$$

42) Calculate the mass of copper placed in 1200.g of water if the specific heat of copper is $0.387 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}$, the initial temperature of the water was $75.4^{\circ} \mathrm{C}$, the final temperature of the water was $95.2^{\circ} \mathrm{C}$, and the initial temperature of the copper was $285^{\circ} \mathrm{C}$.

$$
(\mathrm{m} \mathrm{C} \Delta \mathrm{~T})_{\mathrm{Cu}}=-(\mathrm{m} \mathrm{C} \Delta \mathrm{~T})_{\mathrm{H} 20}(\mathrm{~m})\left(0.387 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}\right)(95.2-285)=-(1200 \mathrm{~g})\left(4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}\right)\left(95.2-75.4^{\circ} \mathrm{C}\right)
$$

$$
\mathrm{m}=1353 \mathrm{~g}
$$

43) How much heat will be released when 1.48 g of chlorine reacts with excess phosphorus according to the following equation?

$$
2 \mathrm{P}+5 \mathrm{Cl}_{2} \rightarrow 2 \mathrm{PCl}_{5}+886 \mathrm{~kJ}
$$

$\frac{1.48 \mathrm{~g} \mathrm{Cl}_{2}-}{1} \times \frac{1 \mathrm{~mole} \mathrm{Cl}_{2}}{70.9 \mathrm{~g} \mathrm{Cl}_{2}} \times \frac{886 \mathrm{~kJ} \mathrm{Cl}_{2}}{5 \mathrm{~mole} \mathrm{Cl}_{2}}=3.70 \mathrm{~kJ}$
44) When a 19.2 g sample of KCN dissolves in 65.0 g of water in a calorimeter, the temperature drops from $28.1^{\circ} \mathrm{C}$ to $15.4^{\circ} \mathrm{C}$. Calculate the $\Delta \mathrm{H}$ for this process.

$$
\begin{aligned}
\Delta \mathrm{H} & =\mathrm{m} \mathrm{C} \Delta \mathrm{~T} \\
& =(65 \mathrm{~g})\left(4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}\right)\left(12.7^{\circ} \mathrm{C}\right) \\
& =3454 \mathrm{~J}=\Delta \mathrm{H}_{\mathrm{H} 2 \mathrm{O}} \\
& \Delta \mathrm{H}_{\mathrm{H} 2 \mathrm{O}}=-\Delta \mathrm{H}_{\mathrm{KCN}}=-3454 \mathrm{~J}
\end{aligned}
$$

$$
\mathrm{KCN}_{(\mathrm{s})} \rightarrow \mathrm{K}_{(\mathrm{aq})}^{+}+\mathrm{CN}_{(\mathrm{aq})}^{-} \quad \Delta \mathrm{H}=?
$$

## Gases

45) Why do gases become a liquid under high pressures and low temperatures?

More collisions( because they are closer together), and more attraction (because they are closer together and have less energy to escape each others attraction),
46) Explain how the total pressure of a mixture of gases in a container can be determined if the amount of each gas is known.
Calculate the moles of each gas, and calculate the pressure of each gas using $\mathrm{PV}=\mathrm{nRT}$. Add all of the individual pressures up to get the total.
47) Explain why the volume of each gas in the container is the same as the size of the container regardless of how much of each gas is present.

Gas particles are far apart, so they can move in between each other easily and spread out to fill the whole container.
48) If equal parts of 3 gases totaling 4.38 moles of gas were added to a 6.03 L container at 305 K , then what is the partial pressure of each gas?

$$
\frac{4.38 \text { moles }}{3}=1.46 \text { moles each } \quad \mathrm{PV}=\mathrm{nRT} \underset{\mathrm{P}=6.06 \mathrm{~atm}}{\mathrm{P}(6.03 \mathrm{~L})}=(1.46 \mathrm{~mole})(0.0821 \mathrm{Latm} / \mathrm{moleK})(305 \mathrm{~K})
$$

49) In question $\# 43$, if 43 L of chlorine gas was consumed in the reaction at 1.04 atm of pressure and 289 K , then how many grams of $\mathrm{PCl}_{5}$ would you expect to produce? How much energy in Joules?

$$
\begin{aligned}
& \mathrm{PV}=\mathrm{nRT} \quad(1.04 \mathrm{~atm})(43 \mathrm{~L})=(\mathrm{n})(0.0821 \mathrm{Latm} / \mathrm{moleK})(289 \mathrm{~K}) \\
& \frac{1.88 \mathrm{~mole} \mathrm{Cl}_{2}}{} \times \frac{1 \mathrm{~mole} \mathrm{PCl}_{5}}{5 \mathrm{~mole} \mathrm{Cl}_{2}} \times \frac{\mathrm{n}=1.88 \mathrm{~mole} \mathrm{Cl}_{2}}{1} \frac{208.22 \mathrm{~g} \mathrm{PCl}_{5}}{1 \mathrm{~mole} \mathrm{PCl}_{5}}=78.29 \mathrm{~g} \mathrm{PCl}_{5} \\
& \frac{1.88 \mathrm{~mole} \mathrm{Cl}_{2}}{1} \times \underset{5}{886 \mathrm{KJ}}=3.26 \times 10^{5} \mathrm{~J}
\end{aligned}
$$

## Solutions

50) Can you make 100 mL 's of a 0.25 M solution from 10 mL of a 5.0 M solution, if so explain how!
$\mathrm{MV}=\mathrm{MV} \quad(0.25 \mathrm{M})(100 \mathrm{~mL})=(5.0 \mathrm{M})(\mathrm{x}) \quad \mathrm{x}=5 \mathrm{~mL}$ of 5.0 m solution since you need 5 mL and have 10 mL , you can do it!!
51) Explain how you can make 250 mL 's of a 0.68 M NaOH solution from solid NaOH .
$\frac{0.68 \text { moles } \mathrm{NaOH}}{1 \mathrm{~L}} \times \frac{0.25 \mathrm{~L}}{1} \times \frac{40 \mathrm{~g} \mathrm{NaOH}}{1 \mathrm{~mole} \mathrm{naOH}}=6.8 \mathrm{~g} \quad$ Add 6.8 g and dissolve in a container filled to 250 mL
52) What is the only thing that you can do to a solution to change the amount of solute that can be dissolved if you cannot change the amount of solvent?

Change the temperature

53) How much $\mathrm{NaClO}_{3}$ can be dissolved in 100 g of water at $65^{\circ} \mathrm{C}$ ?

165 g
54) How much KBr can be dissolved in 45 g water at $80^{\circ} \mathrm{C}$ ?

At $80^{\circ} \mathrm{C}, 95 \mathrm{~g}$ of KBr can be dissolved in $100 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$

$$
\frac{95 \mathrm{gKBr}}{100 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}}=\frac{\mathrm{xg} \mathrm{KBr}}{45 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}}=42.75 \mathrm{gKBr} \text { in } 45 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}
$$

55) How much $\mathrm{KNO}_{3}$ will precipitate if 80 g was dissolved in 100 g of water and the temperature of the water was lowered to $20^{\circ} \mathrm{C}$ ?

At $20^{\circ} \mathrm{C}$ you can dissolve 30 g in 100 g water therefore 50 g will precipitate

## Acids and Bases

56) What is the pH of a solution if the concentration of NaOH is $2.3 \times 10^{-5} \mathrm{M}$ ?

$$
\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(2.3 \times 10^{-5} \mathrm{M}\right)=4.64 \quad \mathrm{pH}+\mathrm{pOH}=14 \quad \text { so } \ldots . \mathrm{pH}=9.36
$$

57) Define an acid and a base using the Arrhenius and the Bronsted-Lowry definitions.

Arrhenius $=$ acids give off $\mathrm{H}^{+}$, bases give off $\mathrm{OH}^{-}$
Bronsted-Lowry $=$ Acids are proton donors, and bases are proton acceptors
58) Explain how adding base to acid produces a neutral solution.
$\mathrm{H}^{+}+\mathrm{OH}^{-}=\mathrm{H}_{2} \mathrm{O}$ add more base to acid and you get water which is neutral
59) What is the $\left[\mathrm{H}^{+}\right]$in a solution that has a pH of 3.8 ? What would the pOH be? $\left[\mathrm{OH}^{-}\right]$?
$10^{-\mathrm{pH}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] \quad\left(\right.$ or $\left.\mathrm{H}^{+}\right)$so $10^{-3.8}=1.58 \times 10^{-4} \mathrm{M} \quad\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=1 \times 10^{-14}$ so $\ldots .\left[\mathrm{OH}^{-}\right]=6.33 \times 10^{-11} \mathrm{M}$
$\mathrm{pH}+\mathrm{pOH}=14$ so $\ldots \mathrm{pOH}=10.2$

## Equilibrium

60) In the following reaction, explain two things that can be done to shift the equilibrium to produce more products:

$$
\mathrm{C}_{2} \mathrm{H}_{4}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}+\text { Heat }
$$

Remove energy, add more reactants, remove some products
61) Write the $\mathrm{k}_{\mathrm{eq}}$ expression for the previous reaction and explain how the $\mathrm{k}_{\mathrm{eq}}$ value can tell you whether you will find more products or more reactants when the equilibrium is reached
$\mathrm{k}_{\mathrm{eq}}=\left[\mathrm{CO}_{2}\right]^{2}\left[\mathrm{H}_{2} \mathrm{O}\right]^{2}$ small keq $=$ favors reactants large keq $=$ favors products $\mathrm{keq}=1$ means equal amounts $\left[\mathrm{C}_{2} \mathrm{H}_{4}\right]\left[\mathrm{O}_{2}\right]^{3}$

## Misc. Calculations

Use the following equation for 62-65
62) If the hydrogen gas was collected in a 0.25 L container under 125 Kpa of pressure at $28^{\circ} \mathrm{C}$, then how many grams of Magnesium were reacted?
$\mathrm{PV}=\mathrm{nRT} \quad(1.23 \mathrm{~atm})(0.25 \mathrm{~L})=(\mathrm{n})(0.0821 \mathrm{Latm} / \mathrm{moleK})(301 \mathrm{~K}) \quad \mathrm{n}=1.24 \times 10^{-2}{\text { moles } \mathrm{H}_{2}}^{2}$
$\frac{1.24 \times 10^{-2} \text { moles } \mathrm{H}_{2}}{1} \times \frac{1 \text { mole } \mathrm{Mg}^{2}}{1 \mathrm{~mole} \mathrm{H}_{2}} \times \frac{24.31 \mathrm{~g} \mathrm{Mg}}{1 \mathrm{~mole} \mathrm{Mg}}=3.02 \mathrm{~g} \mathrm{Mg}$
63) If 58 mL of a 0.15 M HCl solution was used to react excess magnesium, then how many formula units of Magnesium Chloride were produced?

64) If the pH of the starting solution was 3.8 and 50 mL was used, then how many hydrogen atoms were produced?
$10^{-3.8}=\left[\mathrm{H}_{3} \mathrm{O}\right]=1.58 \times 10^{-4} \mathrm{M}[\mathrm{HCl}]=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
$\frac{0.05 \mathrm{~L} \text { solution }}{1} \times \frac{1.58 \times 10^{-4} \text { mole } \mathrm{HCl}}{1 \mathrm{~L} \mathrm{HCl} \text { soln }} \times \frac{1{\text { mole } \mathrm{H}_{2}}_{2 \text { mole } \mathrm{HCl}} \times \frac{6.02 \times 10^{23} \text { molecules } \mathrm{H}_{2}}{1 \mathrm{~mole}_{2}} \times \underset{1 \text { molecule } \mathrm{H}_{2}}{2 \text { atoms } \mathrm{H}}=2.62 \times 10^{21} \mathrm{~F} . \mathrm{U} . \mathrm{MgCl}_{2}}{1}$
65) What is the percent yield if only 43.2 mL of hydrogen gas was collected at 752.5 mmHg and $22.3^{\circ} \mathrm{C}$, and 0.52 g of magnesium was reacted with excess hydrochloric acid?

```
\(\frac{0.52 \mathrm{~g} \mathrm{Mg}}{1} \times \frac{1 \mathrm{~mole} \mathrm{Mg}}{24.31 \mathrm{~g} \mathrm{Mg}} \times \frac{1 \mathrm{~mole} \mathrm{H}_{2}}{1 \mathrm{~mole} \mathrm{Mg}}=2.14 \times 10^{-2} \mathrm{~mole}_{2}\)
\(\mathrm{PV}=\mathrm{nRT} \quad(0.99 \mathrm{~atm})(\mathrm{V})=\left(2.14 \times 10^{-2}\right.\) mole \()(0.0821 \mathrm{Latm} / \mathrm{moleK})(295.3 \mathrm{~K})\)
                \(\mathrm{V}=0.524\) or 524 mL
```

$\%$ yield $=\frac{\text { Experimental }}{\text { Actual }} \times 100=\frac{43.2}{524} \times 100=8.24 \%$
66) What was the pH of the original HCl solution if 25 mL of acid was titrated with 0.2 M NaOH and the phenolphthalein changed color after 45 mL of base was added.
$\mathrm{NaOH}+\mathrm{HCl} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
$\frac{0.045 \mathrm{~L} \mathrm{NaOH} \text { solution }}{1} \times \frac{0.2 \mathrm{~mole} \mathrm{NaOH}}{1 \mathrm{~L} \mathrm{NaOH} \mathrm{soln}} \times \frac{1 \mathrm{~mole} \mathrm{HCl}}{1 \mathrm{~mole} \mathrm{NaOH}}=9 \times 10^{-4}$ mole $\mathrm{HCl} \underset{0.025 \mathrm{~L}}{\mathrm{x}-\frac{1}{2}}=3.6 \times 10^{-2} \mathrm{M} \mathrm{HCl}$
Since HCl only gives $1 \mathrm{H}^{+}$ion, then $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=3.6 \times 10^{-2} \mathrm{M}$ also
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log \left[3.6 \times 10^{-2} \mathrm{M}\right]=1.44$
67) If the half-life of a radioisotope is 5.62 days. How many grams of a 58 gram sample will be left after 33.72 days.

| Amount $(\mathrm{g})$ | \# Half Lives | Time (days) |
| :--- | :--- | :--- |
| 58 | 0 | 0 |
| 29 | 1 | 5.62 |
| 14.5 | 2 | 11.24 |
| 7.25 | 3 | 16.86 |
| 3.625 | 4 | 22.48 |
| 1.813 | 5 | 28.10 |
| 0.9065 | 6 | 33.72 |

68) If 85 mL 's of a gas at STP is compressed into a 0.02 L container at $25^{\circ} \mathrm{C}$, then what was the final pressure in Kpa?

$$
\frac{\mathrm{PV}}{\mathrm{~T}}=\frac{\mathrm{PV}}{\mathrm{~T}} \quad \frac{(101.3 \mathrm{kPa})(85 \mathrm{~mL})}{273 \mathrm{~K}}=\frac{(\mathrm{P})(20 \mathrm{~mL})}{298 \mathrm{~K}} \quad \mathrm{P}=470 \mathrm{kPa}
$$
